

Administrative Control Plan

Company Scenario

NorthStar Logistics Ltd. is a medium-sized logistics and supply chain organization that manages the transportation, storage, and distribution of goods for government agencies and private-sector clients. The company relies on digital systems to coordinate operations, maintain customer records, process shipments, and manage employee information.

Because employees regularly access sensitive operational and business data, management recognizes that human error remains one of the organization's greatest cybersecurity risks. Threats such as phishing attacks, weak password practices, social engineering, and accidental data disclosure can significantly impact business operations if employees are not properly trained.

To strengthen its cybersecurity posture, NorthStar Logistics Ltd. is implementing a comprehensive administrative control plan focused on cybersecurity awareness training. The goal is to ensure that every employee understands their security responsibilities, follows organizational security policies, and can identify, report, and respond appropriately to emerging cyber threats.

Step 1

Administrative Control Selected: Training

NorthStar Logistics Ltd. has selected **Cybersecurity training** as its primary administrative control. This control is designed to educate employees on cybersecurity best practices, reduce human-related security risks, and promote a security-conscious workplace culture.

Effective cybersecurity training equips employees with the knowledge and skills needed to recognize cyber threats, follow organizational security policies, and protect sensitive company

information. By continuously educating employees, the organization strengthens its overall security posture and reduces the likelihood of successful cyberattacks resulting from human error.

Step 2

1. Cybersecurity Onboarding Training

All newly hired employees at NorthStar Logistics Ltd. will complete mandatory cybersecurity onboarding training before receiving access to the organization's systems and data. The training program will introduce employees to the company's cybersecurity policies, security responsibilities, and best practices for protecting organizational information.

The onboarding training will cover the following topics:

- Company cybersecurity policies and acceptable use guidelines.
- Password creation and management, including multi-factor authentication (MFA).
- Identifying phishing emails, social engineering attacks, and other common cyber threats.
- Data classification and the proper handling of sensitive information.
- Safe internet browsing and email security practices.
- Physical security procedures, including visitor management and secure workstation practices.
- Incident reporting procedures and how to report suspected security incidents.
- Secure remote work practices for employees accessing company systems outside the office.

Employees must successfully complete the onboarding training and acknowledge the organization's security policies before being granted access to business applications, company networks, and confidential information.

2. Ongoing Cybersecurity Training

NorthStar Logistics Ltd. requires all employees to complete **mandatory cybersecurity awareness training every three months (quarterly)**.

Quarterly training ensures that employees remain informed about evolving cyber threats, newly identified vulnerabilities, and updates to the organization's security policies. Cybercriminals continuously develop new attack techniques, making regular training essential for maintaining a strong security culture.

In addition to scheduled quarterly training, employees will receive refresher training whenever significant security policy changes occur or when emerging threats require immediate organizational awareness. This approach helps ensure that employees remain prepared to recognize, prevent, and respond to cybersecurity risks throughout the year.

3. Informing Employees About New Cyber Threats

NorthStar Logistics Ltd. will use multiple communication channels to ensure employees remain informed about emerging cyber threats and security updates. The Information Security Team will distribute timely and relevant cybersecurity information through:

- Company-wide email security alerts for newly identified threats.
- Monthly cybersecurity awareness newsletters highlighting current attack trends and security best practices.
- Microsoft Teams announcements for urgent security notifications and policy updates.
- Simulated phishing campaigns to reinforce employee awareness and measure training effectiveness.
- Periodic security awareness meetings and short educational videos covering emerging cyber threats.

Using multiple communication methods ensures that employees receive important cybersecurity information promptly, remain aware of evolving threats, and are better prepared to identify and report suspicious activities before they impact the organization.

Conclusion

Cybersecurity training is one of the most effective administrative controls for reducing human-related security risks within an organization. By providing comprehensive onboarding training, conducting mandatory quarterly awareness sessions, and communicating emerging cyber threats through multiple channels, NorthStar Logistics Ltd. strengthens its overall cybersecurity posture and promotes a culture of security awareness.

Implementing this administrative control plan will help employees recognize cyber threats, follow established security policies, protect sensitive organizational information, and respond appropriately to security incidents. Continuous cybersecurity education ensures that employees remain an effective first line of defense against evolving cyber threats while supporting the organization's long-term security objectives.
